

BAR 1000
7.1.4-CHANNEL SOUNDBAR
WITH DETACHABLE SURROUND
SPEAKERS, MULTIBEAM™
DOLBY ATMOS®, AND DTS:X®

3D SURROUND SOUND WITHOUT LIMITS

“ WHY CHOOSE A SOUNDBAR WITH 3D SOUND?”

Surround sound formats have advanced so much over the years from simple 5.1 systems to Dolby Atmos® 3D surround sound, which gives audio engineers the ability to put you right in the action. Conventional soundbars—while giving you a basic home audio experience—do not have the technology to produce the surround and height effect details that takes your entertainment to a whole new level. Now JBL has the technology to bring this experience into the home like never before.

The JBL Bar 1000 features astounding 7.1.4-channel 3D sound with detachable surround speakers. The soundbar is engineered with two angled tweeters for a wide detailed soundstage, and four up-firing drivers for cinematic 3D height effect. A pair of detachable, battery-powered speakers conveniently provides real surround sound without the hassle of extra speakers and wires. A 10" wireless subwoofer delivers deep, powerful bass extension for music, movies, and games.

Powered by JBL MultiBeam™ technology, it features panoramic surround sound. With built-in Dolby Atmos and DTS:X, JBL Bar 1000 delivers an immersive and exciting 3D sound experience without limits.

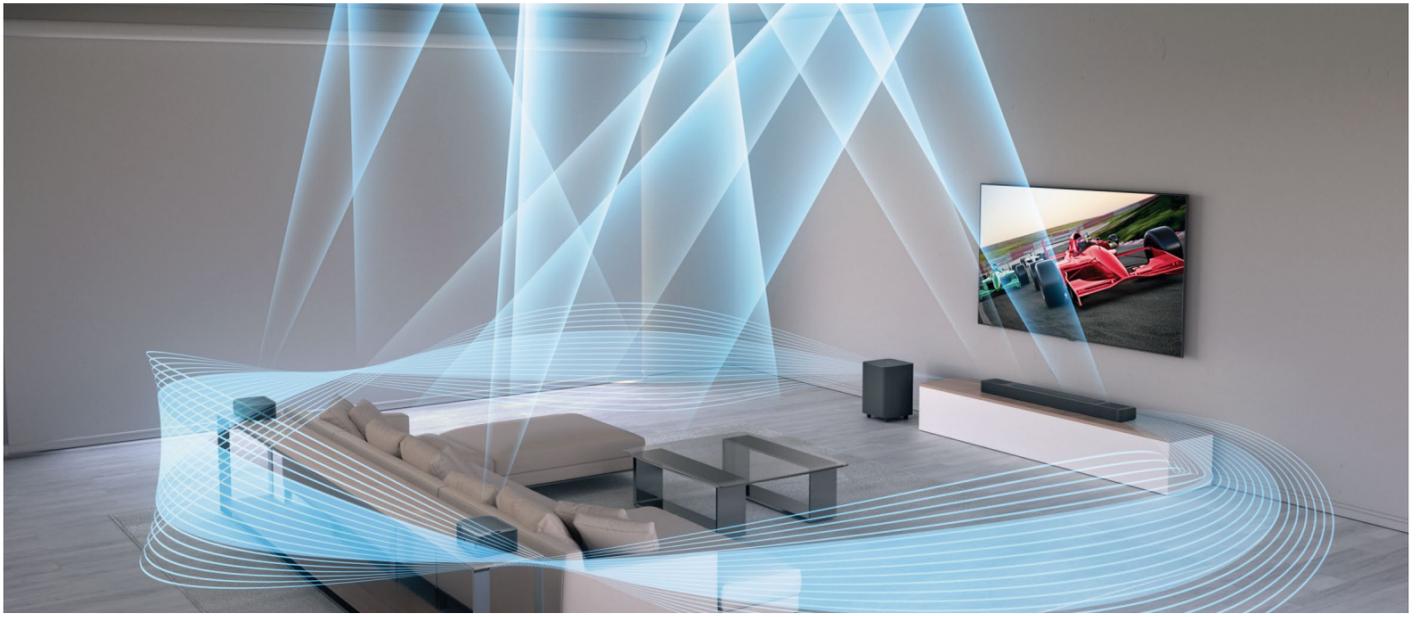

THE BAR 1000 ACOUSTIC DESIGN

The JBL Bar 1000 main soundbar features five front-firing racetrack drivers with neodymium components for clear, detailed sound. A center ¾-inch (20mm) silk dome tweeter helps make dialogue clearer when watching movies. Two tweeters are loaded in angled waveguides to disperse sound into the room with the highest efficiency. The main soundbar features two full-range up-firing drivers to deliver cinematic sound when effects are flying overhead.

The JBL Bar 1000 wireless subwoofer features a 10" down-firing driver designed for low distortion and thunderous bass performance so you can feel the action like never before for your favorite music, movies, and games.

Each detachable, battery-powered surround speaker features a ¾-inch (20mm) silk dome tweeter and an additional up-firing full range driver that further enhances the overhead sound effects for total immersion.

Dolby Atmos dts x

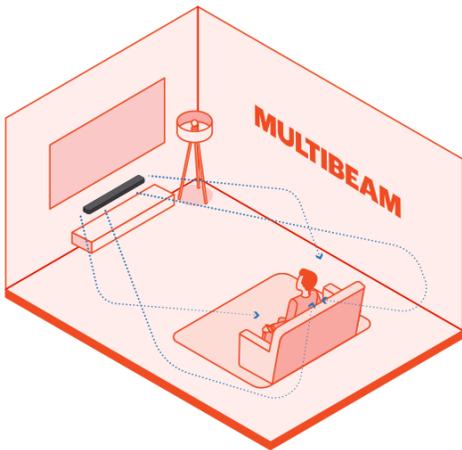

The future of home cinema is here today. Imagine Dolby Atmos® and DTS:X™ as the audio equivalent of 8k ultra-high-definition video. Both formats are the next generation of surround sound technology, bringing you a 3D spacious sound experience. This new technology expands on the well-established channel-based 5.1 and 7.1 surround sound setups, with an additional layer of overhead sound, giving you an even more immersive home cinema experience.

Traditionally, surround sound effects are limited to specific channels, where a portion of the audio is directed to individual speakers. With object-based technologies, sound designers are now able to un-chain sounds from these channels, by designating the trajectories of audio pathways. The Dolby Atmos® and DTS:X system can convert this data and recreate it, to give a 3D spacious surround sound experience.

MULTIBEAM™ TECHNOLOGY

After years of research and development, JBL presents MultiBeam technology: an electro-acoustic system that applies JBL proprietary beamforming technology to replicate the amazing surround sound you expect from a multi-channel audio system.

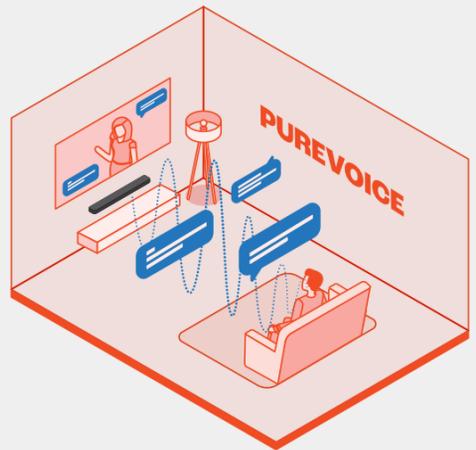

Unlike conventional soundbars that only emit sound in a forward direction, JBL soundbars with MultiBeam combine digital signal processing (DSP), front-firing speakers, and twin side-firing drivers to beam sound at angles towards the side walls of a room. These beams feature the key to generate accurate side wall reflections: a sharp directivity pattern in a wide-band frequency range. These reflections mirror back to the listening location and create a spacious surround sound effect.

PUREVOICE DIALOGUE ENHANCEMENT

Dialogue is an important part of a movie soundtrack but can often be the hardest to hear. Now with PureVoice, a voice enhancement technology for crystal clear dialogue, you will never miss a word.

Conventional dialogue enhancement uses equalization (EQ) to boost frequencies in the vocal range. However, this method negatively affects other parts of the soundtrack that share the same frequency range. JBL PureVoice technology uses digital signal processing (DSP) to detect human speech from within a TV or movie program and extracts the voice content for analysis and improvement. It dynamically enhances the dialogue loudness for crystal-clear intelligibility without affecting other sounds. This enhancement happens automatically, so you never have to reach for the remote control to hear dialogue and miss the moment.

JBL ONE APP

A simple and seamless way to add a whole new dimension to your everyday listening experience. The app provides equalization setting which allows you to personalize the sound just the way you like it. Stream your own playlist with tracks from different music services and control all of your speakers.

SOUND CALIBRATION

The shape of a room, especially side walls, affects how speakers perform and proper calibration during setup is essential for the best sound. Traditional calibration requires a wired microphone and complicated setup. JBL Bar 1000 is designed with an embedded microphone for sound calibration to ensure you get the best sound possible, no matter what kind of room you are in, without the hassle. The system collects acoustic information, measuring when sound is reflected to the microphone. Each reflection arrives at the microphone at different times, and all the reflections are then analyzed. The reflections are reconstructed to estimate the surround sound performance in your specific space. The sound calibration uses a set of filters to correct the loudspeaker EQ to ensure the sound performance is consistent, providing great surround sound, no matter the shape or size of room you are in.

CONNECTIVITY

Enjoy the latest up-to-date connectivity with the JBL Bar 1000. With HDMI eARC (Enhanced Audio Return Channel), it supports uncompressed audio and high-bitrate audio formats like object-based 3D audio for higher quality sound.

Since JBL 1000 works with eARC-enabled TV's, Dolby Atmos 3D surround sound passes from over-the-air broadcasts, TV streaming apps, Blu-ray players, on game consoles to your soundbar. It's easier than ever to experience multi-dimensional sound in your living room with enhanced audio details and depth.

SPECIFICATIONS

| | |
|-----------------------------------|--|
| Product descriptor | 7.1.4-channel soundbar with detachable surround speakers, MultiBeam™, Dolby Atmos®, and DTS:X® |
| Power distribution (Max. @THD 1%) | Total 880W (Soundbar: 340W, Subwoofer: 300W, Surrounds: 2 x 70W) |
| Soundbar transducer | 5x (46x90)mm racetrack drivers, 3x 0.75" (20mm) tweeters, 2x 2.75" (70mm) up-firing full-range drivers |
| Surround speaker transducer | 0.75" (20mm) tweeter, 2.75" (70mm) up-firing full-range driver |
| Subwoofer transducer | 10" (260mm) |
| Sound experience | Dolby Atmos®, DTS:X™, MultiBeam™ |
| HDMI specification | HDMI version 2.1, HDCP v2.3 |
| HDR | HDR10, Dolby Vision |
| Bluetooth | V5.0 |
| Bluetooth profile | A2DP V1.2, AVRCP V1.5 |
| Wi-Fi | Dual Band 2.4/5GHz |
| Streaming service | Chromecast Built-In, Airplay, Alexa MRM, QPlay (China only) |
| Connection | HDMI-eARC x1, HDMI-in x3, Optical x1 |
